(HUMA-) HUMAN GENOME SCI INC

Ruben SM; Barash SC, Rosen CA,

WPI; 2001-465566/50. N-PSDB; AAS40878.

Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.

Claim 11; SEQ ID NO 1004; 1180pp; English.

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           705
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              220
diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), mununodeficiency disorders (e.g. AlDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. infertility) and infectious disorders (e.g. infertility) and invention can also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypoptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                    20
                                                                                                                                                                                                                                                                                                                            40
                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                          80

The present invention describes an isolated publicated.

Comprising a nucleotide sequence selected from SEQ ID NO:1-244; or (b)
which encodes a polypeptide with biological activity, where the
colynucleotide hybridises to (I) under stringent hybridisation conditions
or has greater than 99% sequence identity with (I). (I) has respiratory,

protein antibodies using DNA immunisation techniques; and as an antigen to raise anti-DNA antibodies or elicit another immune response. The polynucleotides and polypeptides can also be used as nutritional sources or supplements, e.g. as a protein or amino acid supplement, as a carbon source, as an itrogen source or as a source of carbohydrates. The compositions are useful for prometing better or faster closure or non-bealing wounds, for the generation and regeneration of tissues, for grotection or regeneration and treatment of lung or liver fibrosis, repertusion injury in various tissues, and conditions resulting from systemic cytokine damage. The compositions can also be used to treat inflammatory conditions (e.g. arthritis, inflammatory bowel disease or crohn's disease), sepsis, rheumatorid arthritis, diabetes mellitus type or graft versus host disease. The present sequence represents an organic various and conditions the present invention. N.B. The sequences for this patent were obtained from the present invention. N.B. The sequence the US20040048249AI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           345
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    465

disease, Parkinson's disease, meningitis, Creutzfeldt-Jakob disease, disease, Parkinson's disease, meningitis, Creutzfeldt-Jakob disease, cerebral palsy, muscular dystrophy, mood, anxiety and schizophrenic disorders); viral, bacterial, fungal and parasitic infections, and autoimmune/inflammatory disorders such as acquired immunodeficiency syndrome (AIDS), allestyles, asthma, Crohn's disease, atopic dermatitis, cy cyndrome (AIDS), allestyles, rheumatoid arthritis or ulcerative colitis. Human ORP proteins and nucleotides can be used to identify compounds condilate their activity or expression. ORP nucleic acid sequences may also be used for assessing the toxicity of a test compound, to detect upstream sequences such as promoters and regulatory elements, and to create knock out or knock in animals or transgenic animals to model human ci sequences and infinal form of disease. Oligonucleotide primers derived from ORP gene sequences may be used to detect single nucleotide polymorphisms (SNPs) and for mapping the naturally occurring genomic sequences. Antibodies specific for ORP or naturally coruring genomic sequences. Antibodies specific for ORP or proteins may be used in the diagnosis of disorders associated with aberrant ORP expression, in assays to monitor patients being treated with companion of the condition of the condition patients being treated with aberrant ORP expression, and for assessing toxicity of potential drugs 8  $\times$  8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          요 요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ठ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
complementary strand of a polynucleotide which comprises a 3'-end sequence, where the
oligonucleotide which comprises a 1'-end sequence, where the
oligonucleotide comprises a 1-east 15 nucleotides and the combination of
the 5'-end sequence/3'-end sequence is selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
complementary full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
che full-length cDNAs. The primers allow obtaining of the full-length
cDNAs easily without any specialised methods. AAH13628 and
AAH13633 to AAH13672 represent human cDNA sequences; AAB02446 to AAB1862
represent human amino acid sequences; and AAH13629 to AAH13632 represent

The invention relates to human dehydrogenase (DHDR)-7 polypeptides

referred to as 62112 and nucleic acid molecules encoding such

CC referred to as 62112 and nucleic acid molecules encoding such

CC polypeptides. DHDR-7 is an acyl-CoA dehydrogenase, a mitochondrial

Elavoprotein which catalyes the first step of fatty acid beta
CC creating a diseace of the invention and their antibodies are useful for

misregulation (e.g. downregulation or upregulation) of DHDR activity.

CC misregulation (e.g. downregulation or upregulation) of DHDR activity.

CC Altheimer's disease (AS), pick's disease, Parkinson's, Huntington's

CC disease, Gilles de la Tourette's syndrome, multiple sclerosis, epilepsy,

CC amyocrophic lateral sclerosis and Creutzfeldt-Jakob disease; autonomic

CC migraine, anxiety, obsessive-compulsive disorder and obesity; cardiac

CC migraine, anxiety, obsessive-compulsive disorder and obesity; cardiac

CC related disorders e.g. arteriosclerosis, ischaemia reperfusion injury,

restenosis, arterial inflammation, angina, hypertension, cardiomyopathy

cm darnythmia; disorders e.g. cancer, diabetes mellitus, hypothyroidism or

CC migration disorders e.g. cancer, diabetes mellitus, hypothyroidism or

CC migration disorders e.g. cancer, diabetes mellitus, hypothyroidism or

CC migration disorders; hepatic assays, predictive medicine e.g.

disorders. They are used for screening assays, predictive medicine e.g.

cimmune deficiency disorders; hepatic disease or dysfunction and metabolic

CC disorders. They are used for screening assays, predictive medicine e.g.

characconstic assays, prognostic assays, monitoring clinical trails, and

CD pharmacogenetics. Polypeptides of the invention

CC are used in gene therapy. The present sequence is human DHDR-7 New human dehydrogenase polypeptide for diagnosing and treating dehydogenase-7 associated diseases and disorders e.g. Alzheimer'disease, and to identify modulators of therapeutic use. Claim 13; Fig 1; 124pp; English. WPI; 2002-329775/36. N-PSDB; AAD34006.

for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including disbetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these anticonvulsant, antiarthritic, osteoathic, antidiabetic, antiarthritic, osteoathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarhitic, osteopathic, ophthalmological and cytostatic activities. This polypepide sequence is a human heart mitochondrial protein of the invention.
Leber's hereditary optic neuropathy; LHON; mitochondrial encephalopathy lactic acidosis and stroke; MELAS; mycolonic epilepsy ragged red fibre syndrome; MERRF; cancer; neuroprotective; nootropic; antidiabetic; anticonvulsant; antiarthritic; osteopathic; ophthalmological; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating
                                                                                                                                                                                                                                                                                 Human heat mitochondrial protein as a therapeutic target SeqID2053

Weng G, Zhang J, Ren F, Xue A, Wang J; tJ, Wang D, Zhao QA, Wang Z; Yang Y, Wen Ghosh MJ,

New isolated polynucleotides and polypeptides, useful for treating, e.g. cancer, lung or liver fibrosis, arthritis, inflammatory bowel disease, Crohn's disease, rheumatoid arthritis, diabetes mellitus type 1 or graft

Claim 20; SEQ ID NO 420; 591pp; English.

comprising a nucleotide sequence selected from SEQ ID No.1-24; or (b) which encodes a polypeptide with biological activity, where the polynucleotide hybridises to (1) under stringent hybridisation conditions or has greater than 994 sequence identity with (1). (1) has respiratory, cytostatic, antiarthritic, antiinflammatory, gastrointestinal, activities, and can be used in gene therapy. (1) can be used for generating polynucleotides encoding chimeric or fusion proteins and neterologous protein sequences. The polynucleotides can be used to express recombinant protein for analysis, characterisation or therapeutic 18e; as markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags to identify chromosomes or to map related gene positions; to compare with endogenous DNA sequences in patients to identify potential genetic disorders; as probes to hybridise and discover primers for genetic fingerprinting, as a probe to subtract-out known sequences in the process of discovering other novel polymoclectides; for sequences in the process of discovering other novel polymoclectides; for sequences in the process of discovering other novel polymoclectides; for support, including for examination of expression patterns; to raise antiportor antibodies using DNA immunisation techniques; and as an antigen to raise anti-DNA antibodies or elicit another immune response. The polymoclectides and polypeptides can also be used as nutritional sources or supplements, e.g. as a protein or amino acid supplement, as a carbon source, as a nitrogen source or as a source of carbohydrates. The polymoclectides and polypeptides can also be used treat cancer. The compositions are useful for promocting better or faster closure of non-healing wounds, for the generation and regeneration of tissues for gut reperfusion injury in various tissues, and conditions resulting from systemic cytokine damage. The compositions can also be used to treat inflammatory conditions (e.g. arthritis, inflammatory bowel disease or Crohn's disease), sepsis, rheumatorid arthritis, diabetes mellitus type or graft versus host disease. The present sequence represents a novel genes, related DNA sequences; as a source of information to derive PCR protection or regeneration and treatment of lung or liver fibrosis, present invention describes an isolated polynucleotide (I): (a)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                       dehydrogenase (VICAD), which binds to insulin-responsive aminopeptidase (IRAP) and to glucose transporter 4 (GLUT4). MD25 has antidiabetic activity. IRAP and GLUT4 are involved in the intracellular regulation of glucose metabolism and glucose transport across the cell membrane. Expression of MD25 (whose ligands are these proteins) is also involved in this regulatory process. MD25 can be used in the prevention, treatment and diaponess of diseases involving disturbances of glucose metabolism, such as diabetes and other hypersylvaemic disorders. The present sequence represents rat VLCAD which is given in the exemplification of the present
                                                                                                                                                                                                                      Protein binding to insulin-responsive aminopeptidase and glucose transporter 4, useful for prevention and treatment of diseases associated with blood sugar level disturbance.

or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a stray, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence which is differentially expressed in neuronal tissue of a first animal cubjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polymucleotides a method for identifying a paramaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more conspicities its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more polymeptides or their antibodies. The polymucleotide or the compound that complates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene the sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed comprised printed specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed comprised printed specification, but was obtained in electronic form directly from MIPO at

dehydrogenase (VLCAD)), which binds to insulin-responsive aminopeptidase (TRAP) and to glucose transporter 4 (GLUT4). MD25 has antidiabetic activity. TRAP and GLUT4 are involved in the intracellular regulation of glucose metabolism and glucose transport across the cell membrane. Expression of MD25 (whose ligands are these proteins) is also involved in this regulatory process. MD25 can be used in the prevention, treament and diagnosis of diseases involving disturbances of glucose metabolism, such as diabetes and other hyperglycaemic disorders. The present sequence represents mouse VLCAD which is given in the exemplification of the

The present invention describes human MD25 (very long chain acyl-CoA dehydrogenase (VLCAD)), which binds to insulin-responsive aminopeptidase (TRAP) and to glucose transporter 4 (GLUT4). MD25 has antidiabetic activity. IRAP and GLUT4 are involved in the intracellular regulation of glucose metabolism and glucose transport across the cell membrane. Expression of MD25 (whose ligands are these proteins) is also involved in this regulatory process. MD25 can be used in the prevention, treatment and diagnosis of diseases involving disturbances of glucose metabolism, such as diabetes and other hyperglycamic disorders. The present sequence represents bovine VLCAD which is given in the exemplification of the
                                                                                                                                                                                                                                                                                      transporter 4, useful for prevention and treatment of diseases associated with blood sugar level disturbance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               249

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

Sequence 2, Application US/09945326

Patent No. US20020127680A1

GENERAL INFORMATION:

APPLICANT: Meyers, Rachel

TITLE OF INVENTION: 62112, A NOVEL HUMAN DEHYDROGENASE AND

TITLE OF INVENTION: USES THEREOF

TITLE OF INVENTION: USES THEREOF

TITLE OF INVENTION: 0.500.09/945,326

CURRENT FILIAG DATE: 2001-08-31

PRIOR PELICATION NUMBER: 60/229,831

PRIOR FILIAGO DATE: 2000-08-31

NUMBER OF SEQ ID NOS: 3

SOFTWARE: PastSEQ for Windows Version 4.0

SEQ ID NO 2:

LENGHH: 621
